चोपडा प्रतिनिधी

श्रीमती शरदचंद्रिका सुरेश पाटील औषधनिर्माण-शास्त्र महाविद्यालय चोपडा येथे दि. २५ सप्टेंबर २०२१ रोजी आंतरराष्ट्रीय फार्मासिस्ट डे चे औचित्य साधून जळगाव येथील अन्न व औषध प्रशासन विभागाचे सहाय्यक आयुक्त विलास बळवंत तासखेडकर यांनी वर्च्युअल मिटच्या माध्यमातून विद्यार्थ्यांना 'औषधनिर्मिती क्षेत्रात फार्मासिस्टचे काम व जबाबदारी' या विषयावर संबोधित केले. सदरच्या चर्चासत्रा दरम्यान पूर्वी फार्मासिस्ट म्हटलं म्हणजे मेडिकल दुकान, प्रोडक्शन, कलिटि एशुरंस इत्यादी सारखे

मर्यादित विभागात कार्यरत होते परंतु बदलत्या काळानुसार औषध निर्मितीतच नव्हे तर वैद्यकीय क्षेत्रात देखील फार्मसीचे महत्त्व व जबाबदाऱ्या वाढतच असून एक बहुआयामी व्यक्तिमत्त्व म्हणून फार्मासिस्टचे योगदान जगासमोर येत आहे.

कोविड-१९ सारख्या महामारी च्या काळात अहोरात्र मेहनत घेऊन कोरोना योद्धासारख्या फार्मासिस्ट समाज सेवेकरिता प्रवृत्त होऊन जगासमोर आला याचा आम्हाला अभिमान असेलच. औषधनिर्मिती, वैद्यकीय व प्रशासकीय सेवेत बी. फार्मसी अभ्यासक्रमानंतर कशाप्रकारे नवीन संधी विद्यार्थ्यांना उपलब्ध होऊ शकतात याबाबतही त्यांनी

आपले विचार विद्यार्थ्यांसमोर व्यक्त केले. कार्यक्रमाचे प्रास्ताविक महाविद्यालयाचे

प्राचार्य डॉ. गौतम वडनेरे यांनी केले तर उपस्थित सर्वांना 'फार्मासिस्ट ओथ' प्रा. सौ क्रांती पाटील यांनी सादर केली.

सदरच्या कार्यक्रमाचे सूत्रसंचालन डॉ. जे.सी. हुंडियाले यांनी केले. जागतिक फार्मासिस्ट डे निमित्त महात्मा गांधी शिक्षण मंडळाचे अध्यक्ष ड. संदीप सुरेश पाटील, उपाध्यक्षा आशाताई पाटील, सचिव डॉ. सी स्मिताताई पाटील यांनी सर्वांना शुभेच्छा व्यक्त करून यशस्वी कार्यक्रम संपन्नतेबद्दल अभिनंदन व्यक्त केले.

कार्यक्रम यशस्वी करण्याकरिता महाविद्यालयाचे प्रबंधक पी. बी. मोरे, सर्व विभाग प्रमुख व शिक्षक कर्मचारीवृंद यांनी परिश्रम घेतले.

Novel Coronavirus (COVID-19) Awareness

Smt. Sharadchandrika Suresh Patil college of Pharmacy has made available the following awareness about COVID-19.

Coronavirus Safety Tips for Everyone

The American Red Cross is closely monitoring the coronavirus disease 2019 (COVID-19) pandemic and following the latest guidance from the U.S. Centers for Disease Control and Prevention (CDC).

The best way to stay healthy is to follow these steps from the CDC:

- Wash your hands often with soap and water for at least 20 seconds, especially after being in a public place, or after blowing your nose, coughing or sneezing. If soap and water are not readily available, use a hand sanitizer with at least 60% alcohol.
- Avoid touching your eyes, nose and mouth with unwashed hands.
- Avoid close contact with people who are sick.
- Wear a cloth face covering to cover your mouth and nose when around others as physical distancing is not always possible. People may spread the infection even prior to having symptoms and you could spread COVID-19 to others even if you do not feel sick. Don't place coverings on young children under age 2, anyone who has trouble breathing, or is unconscious, incapacitated or otherwise unable to remove the mask without assistance. Learn more.
- Stay home if you are sick, except to get medical care.
- Cover your nose and mouth with a tissue when coughing or sneezing and throw the tissue away after use. If a tissue isn't available, cough or sneeze into your elbow or sleeve, not your hands.
- Clean and disinfect frequently touched surfaces daily. This includes tables, doorknobs, light switches, handles, desks, computers, phones, keyboards, sinks, toilets, faucets and countertops.
- If surfaces are dirty, clean them. Use detergent, or soap and water, prior to disinfecting. Find full information on how to disinfect [here](https://www.redcross.org/get-help/how-to-prepare-for-emergencies/types-of-emergencies/coronavirus-safety.html).
- Wear a facemask if you are sick. You should wear a facemask when you are around other people (e.g., sharing a room or vehicle) and before you enter a healthcare provider's office.

How Does Covid-19 Spread?

According to the U.S. Centers for Disease Control and Prevention CDC, COVID-19 symptoms include fever, shortness of breath or a cough. Symptoms may appear 2-14 days after exposure. Call your doctor for medical advice if you think you have been exposed to COVID-19 and develop symptom

- According to CDC, the virus is thought to be spread mainly from person to person. It may spread between people who are in close contact with one another (within about 6 feet), or through respiratory droplets when an infected person coughs or sneezes. These droplets can land in the mouths or noses of people who are nearby and possibly get inhaled into the lungs.
- The CDC also reports that it may be possible for someone to get COVID-19 by touching a surface or object with the virus on it, and then touching their own mouth, nose, or possibly their eyes, but these is not thought to be main way the virus spreads.
- The best way to prevent illness from COVID-19 is to avoid being exposed to the virus, as there is no vaccine to prevent COVID-19

Emergency Warning sign

If your symptoms become severe, call to get medical attention immediately, Warnings signs include,

- Trouble breathing
- Persistent pain or pressure in the chest
- New confusion
- Inability to wake or stay awake
- Bluish lips or face

This list is not all inclusive. Consult your medical provider for any other symptoms that are severe or concerning. Call 911 if you have a medical emergency and note if you have, or think you might have, COVID-19.

Follow these five easy steps to help prevent the spread of COVID-19

Sneeze or cough? Cover your nose and mouth with a tissue or use your elbow.

Wash your hands often with soap and water for at least 20 seconds.

Clean and disinfect surfaces around your home and work frequently.

Keep at least 6 feet between yourself and others if you must be in public.

Wear a cloth face covering over your mouth and nose when around others.

CORONA VIRUS DEALS BIG BLOW TO PLACEMENT

The coronavirus pandemic has been affected globally and it has stretched the capacities of governance, public health infrastructure and social administrations of affected nations to their limits. At the same time lockdown enforced to prevent the spread has brought economics to the ground and jeopardized the job prospects of many. With unemployment soaring during these tough times, recent graduates waiting in the wings and looking for their first job feel marooned. According to the All India Survey of Higher Education by the Ministry of Human Resource Development, India saw 32.9 lakh students graduate from the Arts, Commerce, Science streams in 2019.

In an already bleak job market with growing unemployment rates, a majority of these graduates are likely to find it extremely difficult, if not impossible, to secure employment.

COVID-19 has not only altered our ways of life radically in the present, it has also thrown the future of lakhs into question.

I) Students are Uncertain

Across the country, graduates are anxious about their job prospects. They are fearful of what will be left of their hopes and are bracing for an uncertain future. Students who had turned down the idea of pursuing a higher education in favour of jobs have also begun regretting their decision.

II) Paying education loans

Many students took out education loans to complete their studies and pinned hopes on the jobs they would get, to help them repay the loans and ease the financial burden on families. Economic relief measures proposed by the Central Government, a three-month moratorium on the payment of EMIs for term loans, including educational loans, is on the cards. But the interest accrued will not be waived. This will result in borrowing paying a higher instalment for repayment.

Colleges and recruiters in an uncertain period of awaiting a decision:

Firms too are caught in stagnation, with their decision on hiring and expanding dictated by the lockdown and its effects. IT services and startups recruitment, in particular, could be affected badly by crunch caused by the lockdown. Many firms are now mulling freezing salary hikes and promotions and hiring is expected to get slower. The coming months: A workaround to the crisis has been suggested by the Association of India Universities (AIU) through a few platforms for colleges and companies to overcome the hurdle in hiring. The AIU has partnered with Jeevitam an MOU partner of the labour ministry to conduct online placements for students during the ongoing crisis. Member universities could register by paying a fee Rs.10,000 to conduct digital placements for each institute.

Ministry of human Resources has issued a plea to all companies who have recruited so far, to not withdraw their job offers owing to COVID-19. In a meeting with educational institutions, the MHRD has asked for special placements drives to be held for those who are unable to secure or retain jobs during this time.

The longer term outlook regarding the employment prospects of the current graduates including in terms of salary can only be determined in the next few months.

Suggestions for students:

Be proactive in reaching out to companies, write to as many firms with your CV
Look beyond the traditional avenues, explore the startup ecosystem for jobs
Hone additional skills in your subject of qualification
Learn a foreign language
Take up freelance assignments
Explore remote work through websites that connect with prospective employers
Take up an internship

"Impact of social distancing, lockdown and innovations on the spread of COVID-19"

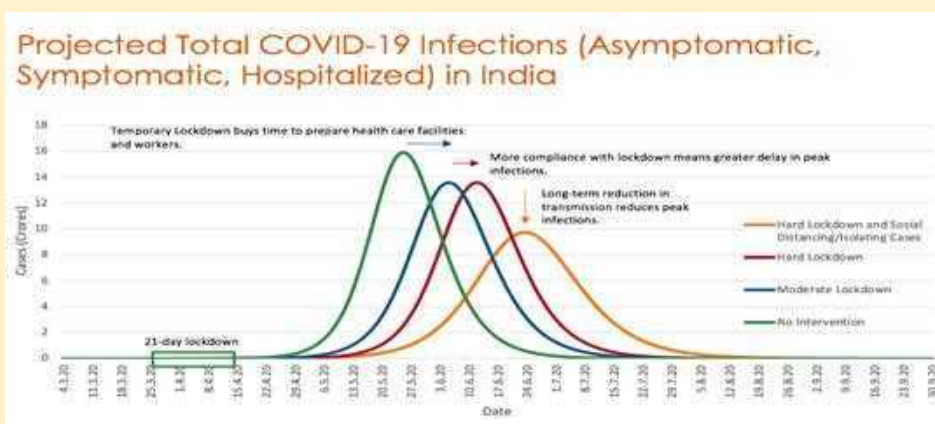

The outbreak of corona virus disease 2019 (COVID-19) which originated in Wuhan, China, constitutes a public health emergency of international concern with a very high risk of spread and impact at the global level. To contain the spread of the novel virus and to keep infections at a manageable level, many countries have instituted lockdowns and social distancing. In India, a nation-wide 21-day lockdown was announced with effect from 25 March 2020. This lockdown is expected to avert a sudden and large increase in the number of infections in the short term. • Additionally, interventions such as social distancing and isolation of infected individuals over several months could reduce peak infections. • Interventions such as frequent hand washing, reduced mass gatherings, contact tracing, and quarantines could slow transmission and reduce overall infections. Confirmed cases have spread worldwide, with 1,428,428 cases in 121 countries on 7 April.

COVID-19 Cases in India

- 1) COVID-19 cases began in late January with 3 confirmed cases but accelerated to 28 confirmed cases on 4 March 2020.
- 2) On 28 March 2020, near the beginning of the lockdown, there were 909 confirmed cases in India with 85% of these hospitalized.
- 3) As of 9 April 2020, COVID-19 cases have been identified in 31 Indian states and union territories.
- 4) Testing continues to be rapidly expanded – expect to see additional cases in near future due to increased testing of the population.

COVID-19 India: Cases, hospitalizations and deaths (over a one-week period during lockdown from 28 March-3 April 2020)

Date	Samples tested	COVID+ cases	COVID+ cases hospitalized	COVID+ cases recovered/ cured/ migrated	COVID + deaths
28 March 2020	NA	909	776	80	19
30 March 2020	NA	1251	942	102	32
1 April 2020	NA	1637	1467	133	38
3 April 2020	NA	2301	1764	157	56

Above graph shows an impact of the 21-day lockdown on the spread of COVID-19 in India; before, during, and after the lockdown is lifted. The analysis includes four scenarios:

- 1) Baseline – Disease continues to spread with no lockdown, social distancing, or other intervention and no change in transmission rate. $R_0 = 2.66$.
- 2) Moderate Lockdown – Reduce transmission to R_0 of 2 during lockdown period, then transmission resumes at R_0 of 2.4.
- 3) Hard Lockdown – Reduce transmission to R_0 of 1.5 during lockdown period, then transmission resumes at R_0 of 2.4.
- 4) Hard Lockdown and Continued Social Distancing/Isolating Cases– Reduce transmission to R_0 of 1.5 during lockdown period, then, through social distancing regulations and isolation of symptomatic individuals, resumes at R_0 of 2.

India's current lockdown will significantly slow the spread of COVID-19 hospitalizations and moderate infections compared to a lack of interventions.

5) The results of this analysis suggest that immediate physical distancing will reduce the burden of COVID-19 on the healthcare system and reduce the risk of mortality among high-risk patients. 6) A temporary lockdown allows time to build the capacity of hospitals and health care workers. 7) Long-term impacts can be achieved through a combination of policies that reduce the transmission of the virus including immediate isolation of all individuals demonstrating symptoms of influenza-like illness, physical distancing and universal masking, restrictions on large gatherings and events, improved sanitation and hygiene, and increased testing availability.

8) The primary effect of an extensive, temporary lockdown is to provide time to the health system by delaying peak infections until adequate health care infrastructure, personnel and equipment can be obtained.

9) Multiple periods of tightening and loosening restrictions may have a similar effect, but restrictions would need to be tightened often to avoid a high peak of infections and hospitalizations. It is also important to note that fragmented frequent changes in lockdown policy or fragmented policies (states vs. states and state vs. centre) can result in policy confusion and community fatigue for enforcement. Pharmacovigilance as Career Guidelines

Pharmacovigilance, which is one of the unique careers, is associated with life science and pharmacy. The role of this scientific discipline is to analyse the side effects of drugs; they monitor the safety of drugs that are available in the market. Whenever any effect is reported, the pharmacovigilance professionals are the ones who follow up with the case and carry out the necessary tests, etc. accordingly. Briefly, pharmacovigilance professionals have to monitor, assess, detect and prevent the adverse effects of medicines.

How To Pursue A Career In Pharmacovigilance:

Candidates who have graduated from life sciences degree such as botany, zoology, biotechnology, microbiology, biochemistry, genetics, etc. are eligible to pursue this field. One can also pursue pharmacovigilance with chemistry

as a subject at postgraduate or undergraduate level. However, 50% marks in aggregate are required. Pharmacovigilance Courses After their graduation, one can take up a certificate or a diploma course related to the pharmacovigilance. There are many certificate courses available for interested candidates. However, the duration varies from one course to another. Institute of Clinical Research India (ICRI), which has branches across the country, offers diploma courses in pharmacovigilance. The Faculty of Clinical Research (FCR) offers one-year postgraduate diploma and executive diploma course in pharmacovigilance. The Professional Certificate in Pharmacovigilance, offered by Catalyst Clinical Services, is also one of the best available courses. Pharmacovigilance Scope India is one of the largest producers of pharmaceuticals in the world and is popular even for exporting the pharmaceuticals. There are more than 8000 licensed drug manufacturers in India which will recruit pharmacovigilance professionals in good numbers. There are many job opportunities abroad, in countries like the United States and the European countries, too. Pharmacovigilance Opportunities As stated above, there will be no shortage of jobs in this field. Candidates will find many job opportunities in pharmaceutical companies along with a few positions in the public sector. Some of the top recruiting companies are Dr Reddy's lab, Cipla, Ranbaxy Laboratories, Johnson & Johnson, Matrix laboratories Ltd., Pfizer, Ranbaxy, Asian Clinical Trials, Merck, and Novartis.

Pharmacovigilance Job Responsibilities:

The roles and responsibilities of the pharmacovigilance professional include tracking of all the reports related to drugs. They have to review and assess all the documents on drugs. The professional has to enter the database reports as well besides performing the label assessment. Pharmacovigilance Salary After completing the certificate or diploma course in pharmacovigilance, one can start their career in this profession.

Nanorobotics as a Nanomedicine

Potential uses for nanorobotics in medicine include early diagnosis and targeted drug-delivery for cancer, biomedical instrumentation, surgery, pharmacokinetics, monitoring of diabetes, and health care.

In such plans, future medical nanotechnology is expected to employ nanorobots injected into the patient to perform work at a cellular level. Such nanorobots intended for use in medicine should be non-replicating, as replication would needlessly increase device complexity, reduce reliability, and interfere with the medical mission.

Nanotechnology provides a wide range of new technologies for developing customized means to optimize the delivery of pharmaceutical drugs. Today, harmful side effects of treatments such as chemotherapy are commonly a result of drug delivery methods that don't pinpoint their intended target cells accurately. Researchers at Harvard and MIT, however, have been able to attach special RNA strands, measuring nearly 10 nm in diameter, to nanoparticles, filling them with a chemotherapy drug. These RNA strands are attracted to cancer cells. When the nanoparticle encounters a cancer cell, it adheres to it, and releases the drug into the cancer cell. This directed method of drug delivery has great potential for treating cancer patients while avoiding negative effects (commonly associated with improper drug delivery). The first demonstration of nanomotors operating in living organism was carried out in 2014 at University of California, San Diego. MRI-guided nanocapsules are one potential precursor to nanorobots.

Another useful application of nanorobots is assisting in the repair of tissue cells alongside white blood cells. Recruiting inflammatory cells or white blood cells (which include neutrophil granulocytes, lymphocytes, monocytes, and mast cells) to the affected area is the first response of tissues to injury. Because of their small size, nanorobots could attach themselves to the surface of recruited white cells, to squeeze their way out through the walls of blood vessels and arrive at the injury site, where they can assist in the tissue repair process. Certain substances could possibly be used to accelerate the recovery.

The science behind this mechanism is quite complex. Passage of cells across the blood endothelium, a process known as transmigration, is a mechanism involving engagement of cell surface receptors to adhesion molecules, active force exertion and dilation of the vessel walls and physical deformation of the migrating cells. By attaching themselves to migrating inflammatory cells, the robots can in effect “hitch a ride” across the blood vessels, bypassing the need for a complex transmigration mechanism of their own. As of 2016, in the United States, Food and Drug Administration (FDA) regulates nanotechnology on the basis of size.

PHARMA UPDATES

Nipah Virus Infection

Nipah Virus Infection (NiV) is an emerging infectious disease of public health importance in the South-East Asia Region.

NIPAH

OUTBREAKS

Nipah virus infection has proven to be fatal in 70 per cent of the cases. Since the first outbreak which happened in 1998 in Malaysia, the incidents of outbreak have occurred almost every year in Bangladesh and twice in West

The virus

The virus is named after the Malaysian village where it was first discovered. This virus along with Hendra virus comprises a new genus designated Henipavirus in the subfamily *Paramyxovirinae*.

Reservoir of virus

Fruit bats of the genus *Pteropus* have been identified as natural reservoirs of NiV. A seroepidemiologic study in Malaysia implicated four fruit bat species, *Pteropus hypomelanus*, *P. vampyrus*, *Cynopterus brachyotis*, *Eonycteris spelaea*, and an insectivorous bat, *Scotophilus kuhlii*.³ Nipah virus has been isolated from the brain and spinal fluid of victims in Malaysia.⁴ Infective virus has also been isolated from environmental samples of bat urine and partially-eaten fruit in Malaysia.⁵

The mode of transmission

Infected bats shed virus in their excretion and secretion such as saliva, urine, semen and excreta but they are symptomless carriers. The NiV is highly contagious among pigs, spread by coughing. Direct contact with infected pigs was identified as the predominant mode of transmission in humans when it was first recognized in a large outbreak in Malaysia in 1999. Ninety percent of the infected people in the 1998-1999 outbreaks were pig farmers or had contact with pigs.

Species susceptible to Niv: humans, pigs, bats, dogs, cats, goats and horses are sensible to Niv infection

Magnetic Bacteria- as Nanorobotics

Researchers at the Polytechnique Montreal NanoRobotics Laboratory have found that a bacterium called *Waters* with little oxygen, imbued with magnetic capabilities can be a way to deliver targeted loads of chemotherapy effects. The bacteria have adapted to the environment with magnetic nano crystals that act like a compass guiding them north, as well as oxygen sensors that lead them to the deeper waters. Many nanocarriers reach a tumour via passive delivery doesn't allow them to penetrate a tumour in a way that some of the tumours' most active parts remain intact. These are the tumours' hypoxic zones and are thought to be they are also known to have less oxygen than surrounding areas.

These bacteria, led to a tumour using a programmed magnetic field, burrowed deep within to "find" the hypoxic zones. The researchers attached drug vesicles to the tumour. Normally, only about 2% of drugs make it inside. "The ability to actively and precisely target drug delivery to a tumour will help reduce side effects and potentially improve the efficacy of treatments."

Axiostat: India's first USFDA- approved wound dressing product

It wants to focus on India and other emerging markets, while at some stage, perhaps sometime in 2019, it may also look at a for a Being touted as the first US Food and Drug Administration (USFDA) approved wound-care product from India, Axiostat stops uncontrolled bleeding from wounds. Easy to use, it is a handy pack of about 8X8 centimetres. The patch when applied on a wound reacts with blood and within a minute of application forms a clot and becomes an extremely sticky adhesive. Talking about the product, Leo Mavely, founder and CEO of Bengaluru-headquartered Axio Bio solutions, says, while the company was set up about a decade ago, it went commercial only in 2014. It got the approval from the US drug regulator in February this year. The company has so far supplied the product to the Indian army and some of the military and private (corporate) hospitals. "So far, we have shipped close to 450,000 units. About 18 months ago, we set up our own manufacturing unit (earlier used to outsource) in Ahmedabad with a capacity to make 850,000 units per annum and this we hope will handle demand for the next two

years," says Mavely. The technology, he says, has a patent in India and is one of the first product in the world to have 100 per cent active ingredient - Chitosan - sourced from shellfish. "It is a novel biomaterial and we source it from shellfish. It has no protein content so is fully biocompatible for use in human body," says Mavely. The product is made 100 per cent from the active ingredient - Chitosan - and that is its USP. The company has already raised a total of over Rs 60 crore from Ratan Tata's RNT Capital (early this year) and earlier from Accel Partners and IDG Ventures India.

It wants to focus on India and other emerging markets, while at some stage, perhaps sometime in 2019, it may also look at a foray into the US market. It already has an office in Boston and is scouting for a partner in the US - could be a group purchasing organization or a large distributor that works with the public health system in the US. Axio Bio solutions has close to 100 employees, including those in the R&D, sales, production and quality into the US market.

Mushrooms of the Far East hold promise for the anti-cancer therapy03 may 2018

Mushrooms from the Far East area contain the natural chemical compounds, which could be used for the design of the novel drugs with highly specific anti-tumor activities and low-toxicity. These compounds may offer new avenues for oncology, providing us with either stand-alone alternatives to chemotherapy, chemo preventive medicines, or drugs to be used in combination with other therapies. It contains the list of tumors, which were reported to be promising targets of the fungal compounds. Among them sarcoma, leukemia, rectum and colon cancer, stomach cancer, liver cancer, colon carcinoma and others. For the purpose of the current study scientists chose mushrooms widely used in Asian and Far Eastern folk medicine: Fomitopsis pinicola, Hericium erinaceus, Inonotus obliquus, and Trametes versicolor. These species of fungi were shown to selectively target certain malignant tumors. The desired effect is achieved thanks to the various bioactive compounds contained in the mushrooms: polyphenols, polysaccharides, glucans, terpenoids, steroids, cerebrosides, and proteins. These substances are not only capable to hit different critical targets within cancer cells levels but also in certain cases to synergistically boost the chemo. Scientists emphasize that four species of fungi were chosen due to the fact that their medicinal properties are relatively well described. Some of them are already actively used for the anti-cancer drugs manufacturing in certain countries. Undoubtedly, there are many other species of fungi that contain chemical compounds to defeat cancer cells. In ancient China mushrooms were considered as the most effective treatment for the various types of tumors. Contemporary fungo therapy (treatment by means of mushrooms) represents a promising field for scientific research. The natural chemical compounds contained in fungi have a huge therapeutic and particularly the anti-cancer potential that has not been yet fully studied", says Professor Vladimir Katanaev, Dr. Habil, Ph.D., Head of the Laboratory of Pharmacology of Natural Compounds of the Department of Pharmacology and Pharmacy of the School of Biomedicine, FEFU. Another co-PI and corresponding author of this work, director of the center for genomic and regenerative medicine of the School of Biomedicine, FEFU, Alexander Kagansky, notes that despite that the interest in mushrooms studying has been growing exponentially over the past 60 years, about 90% of the fungal species have never been analyzed for their antibiotic and antitumor activities.
